### CRUK Cambridge Centre Clinical PhD project

<b>PhD Project Title</b>	<b>Developing non-invasive point-of-care tests for prostate cancer for earlier detection of aggressive disease</b>
<b>Head of Laboratory (PI) Name</b>	<a href="#">Charlie Massie</a>
<b>Second supervisor if applicable</b>	Andrew Flewitt
<b>Programme</b>	<a href="#">Early Detection</a>
<b>Supervisor's Email</b>	<a href="mailto:Cem45@cam.ac.uk">Cem45@cam.ac.uk</a>
<b>Laboratory Location</b>	<a href="#">Hutchison-MRC</a> <a href="#">Department of Oncology</a>

<b>Project Outline</b>	<p><b><u>Aims and objectives</u></b></p> <p>Prostate cancer management currently relies on low specificity assessments, such as PSA and DRE. Recent advances in image-guided biopsies [1] and improved clinical risk stratification [2] will have a positive impact on patient management. However, there remains uncertainty around the best strategy for clinical management of a large number of men with prostate cancer. For example, 1-in-4 men with intermediate risk disease will progress during active surveillance and delaying treatment for these men may affect their outcome. An equally important consideration is the 3-in-4 men whose prostate cancer will not progress in their lifetimes and who should be spared radical treatments that often have severe side effects.</p> <p>This PhD project aims to address the need for better assays and closer monitoring of men with intermediate risk disease by combining expertise in prostate cancer molecular signatures (C. Massie [3]), point-of-care engineering solutions (A. Flewitt [4]) and clinical studies and risk profiling (V. Gnanapragasam [1,2]).</p>
<b>Experimental plan</b>	<p>Specifically aims of this project:</p> <ol style="list-style-type: none"> <li>1. Develop specific assays for molecular analysis of tissue and liquid biopsy samples</li> <li>2. Implement these markers on acoustic wave sensors to develop low cost, point-of-care devices</li> <li>3. Test these detection devices alongside SOC on active surveillance to assess sensitivity and specificity</li> <li>4. Statistical analysis to assess discriminative power and 'lead-times' in large sample collections</li> </ol>

<p><b>Main Techniques</b></p>	<p>Translational implementation of genomics and molecular biology techniques, to include:</p> <ul style="list-style-type: none"> <li>• allele specific analysis of cell-free tumour DNA (e.g. probes or label incorporation)</li> <li>• functionalization of target molecules for efficient detection on sensor surface</li> <li>• running clinical samples on POC devices and classical molecular assays</li> <li>• statistical analysis of cell-free tumour DNA analysis methods and clinical data (+FU) to test the utility of these methods and inform design of clinical trials.</li> </ul>
